

Introduction

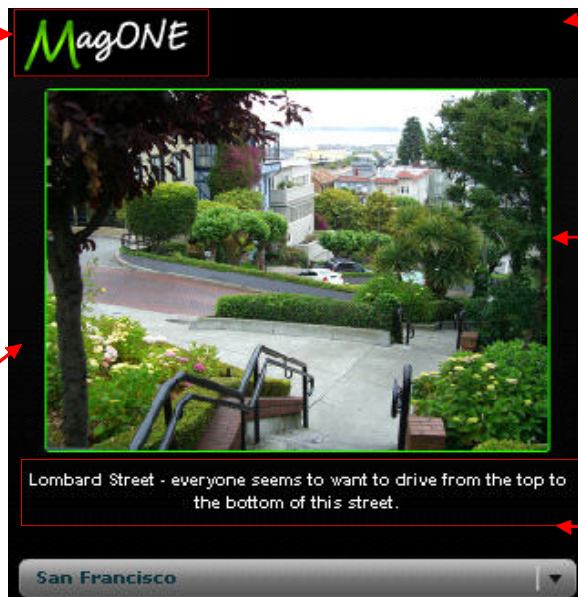

MagONE is a flash based photo slideshow viewer for SmugMug accounts. The application can be added to any web site or page that supports the embedding of flash applications. The standard widget can be embedded by using the tools and instructions available on the <http://www.magnatronus.com/node/2> web page.

Customisation

The application has some standard customisation features that enable the "look and feel" to be changed so that it reflects the site it is being used on and company image that is using it.

MagONE standard customisation points

Logo can be changed or removed

Colour of header can be changed to match any new logo

Photo border colour can be changed

Background colour can be defined

Text colour can be modified

Redlining on widget is for highlighting only and will NOT appear on the widget

To replace the logo you will need to supply a graphic (jpeg or gif) approximately 105x40 pixels (WxH). These dimensions are not exact as it could be slightly larger or smaller, just keep in mind that the logo size affects the layout of the application.

The customised widget will have all the features of the standard application at the time of customisation and will be "hard coded" to your SmugMug account so that it can only be used against that particular account. We will also set up a test page on our site to enable you to see the result of the customisation and supply you with the correct embed code.
